Text mining
From Wikipedia, the free encyclopedia

Text mining, sometimes alternately referred to as "text data mining", roughly equivalent to text analytics, refers to the process of deriving high quality information from text. High-quality information is typically derived through the devising of patterns and trends through means such as statistical pattern learning. Text mining usually involves the process of structuring the input text (usually parsing, along with the addition of some derived linguistic features and the removal of others, and subsequent insertion into a database), deriving patterns within the structured data, and finally evaluation and interpretation of the output. 'High quality' in text mining usually refers to some combination of relevance, novelty, and interestingness. Typical text mining tasks include text categorization, text clustering, concept/entity extraction, production of granular taxonomies, sentiment analysis, document summarization, and entity relation modeling ("i.e.", learning relations between named entities).

VIEW RESULTS AND ACCESS CONTENT >

After you've identified an item of interest, you can access or locate the content, or use other features to further aid you in your research.

Save items to your folder for citation export, emailing and printing during your session. Or using the buttons in the right pane, cite or email a single item.

Image and label indicate type of content and the availability of the item online at your library.

View additional information about the item in the right pane by hovering over the title. You can conduct new searches by clicking on the subject, author, or other terms.
